# **Improving the accuracy of geodesy and astrometry by VLBI Global Observing System**

Ming Hui Xu

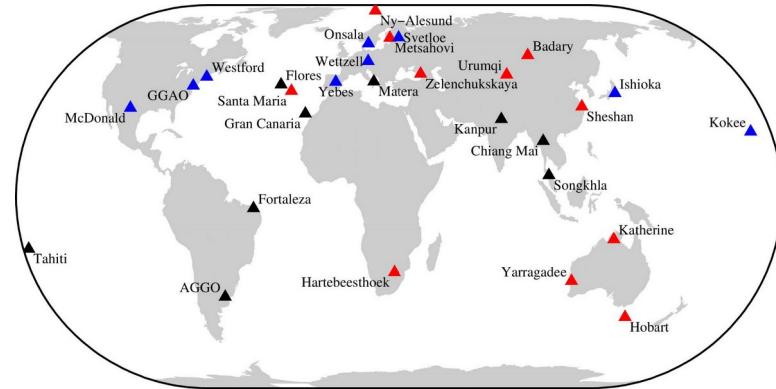

GFZ, Germany

13 November 2024, Radio 2024  
Erlangen, Germany

# Geodetic and astrometric VLBI

**Global terrestrial reference frame  
VGOS station network**

*Status:* **Observing**; **Testing**; **Constructing**

Regular observations with worldwide distributed antennas since 1979

- A network of typically 7 to 15 antennas
- Observing 24 hours per day and 4 days per week
- Tens to hundreds of AGNs in 24 hours

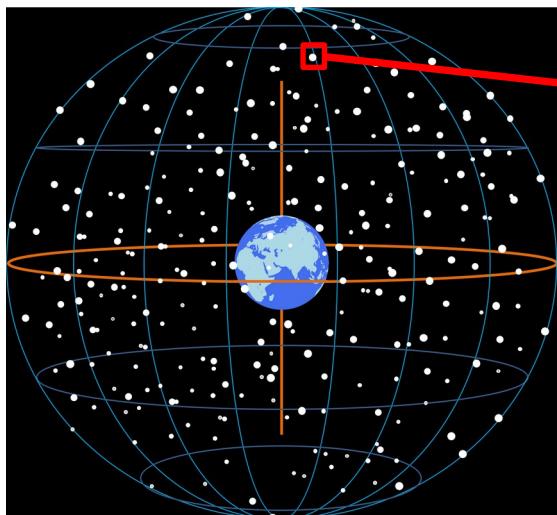

New generation geodetic VLBI since 2019

- Called VLBI Global Observing System (VGOS)
- Simultaneously observing at four bands 3 – 11 GHz

# Geodetic and astrometric VLBI

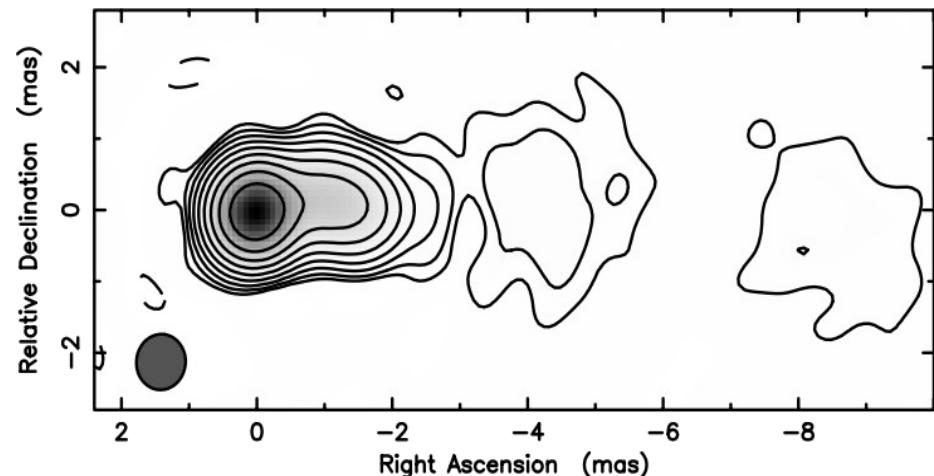

Quasars are lighthouses of VLBI

Earth and quasars

**Assumption:**  
They are point like

**A real quasar:** time- and frequency-dependent structure

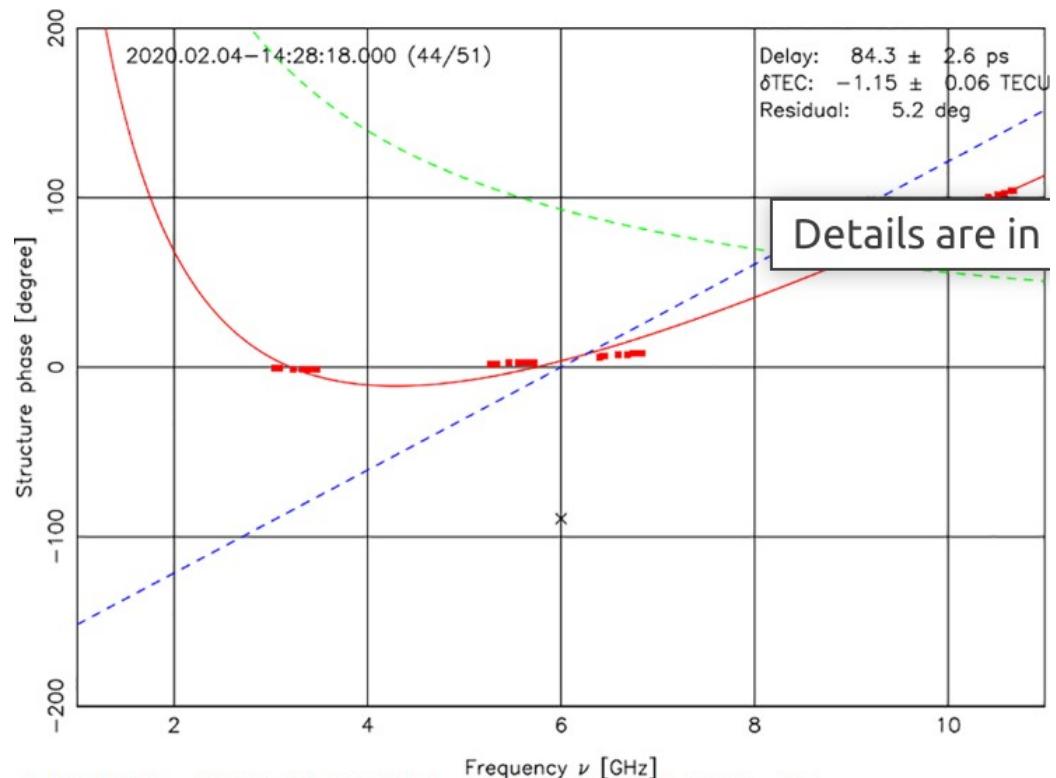

(**Xu** et al., JGR, 2021; A&A, 2022)

One major systematic error is the un-modeled effects due to source structure.

# Effects of source structure in VGOS

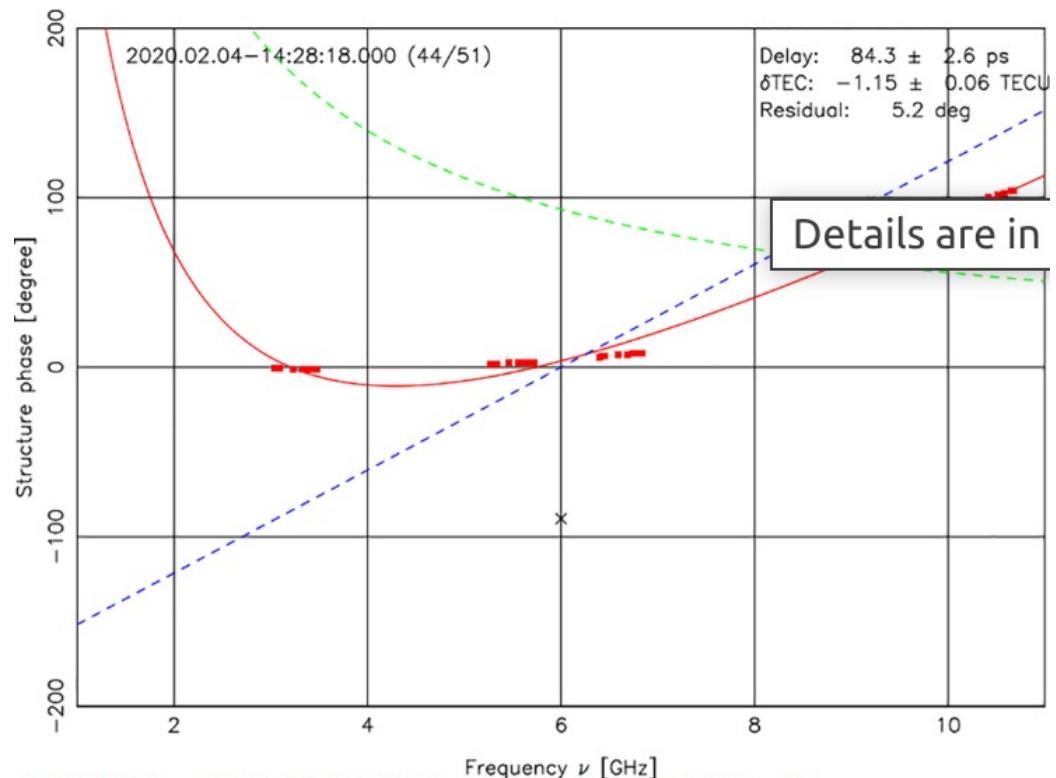

- Variations in absolute astrometric positions of AGNs
- Extra structure delays in the group delay observables
- Enlarging the measurement noise due to resolved structure
- Sub-ambiguities
- .....

(Xu et al., 2021)

# Effects of source structure in VGOS

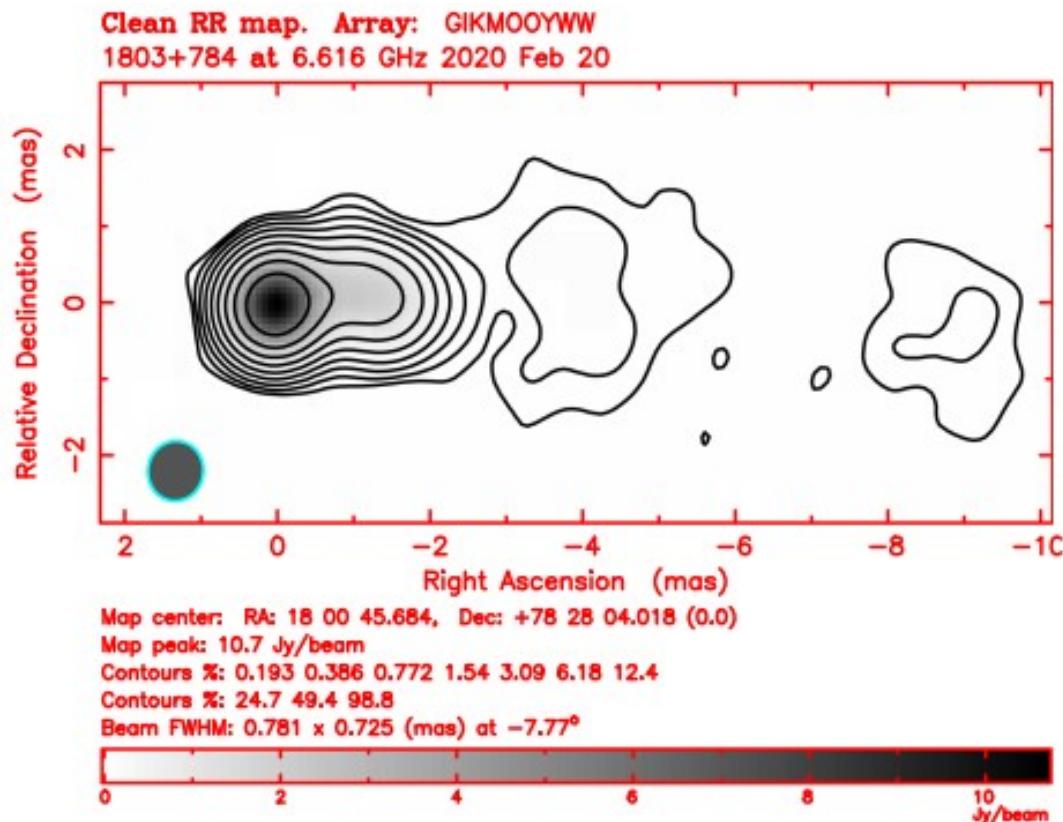

- **Variations in absolute astrometric positions of AGNs**
- Extra structure delays in the group delay observables
- Enlarging the measurement noise due to resolved structure
- Sub-ambiguities
- .....

(Xu et al., 2021)

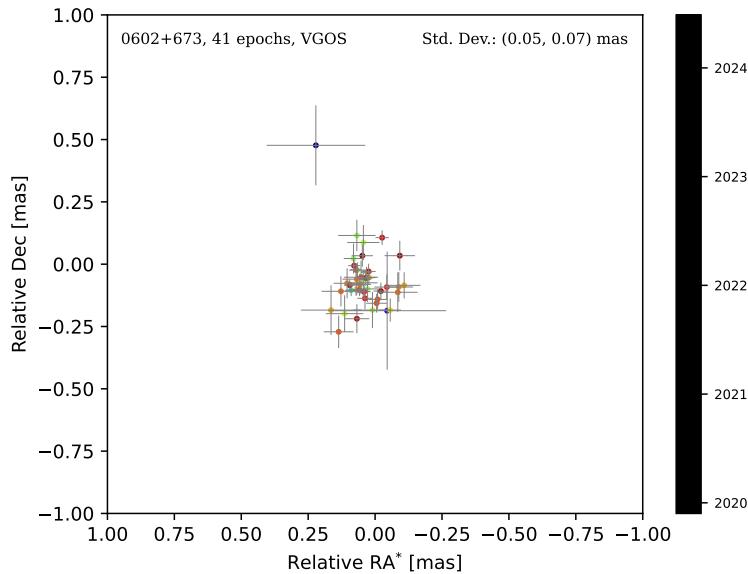

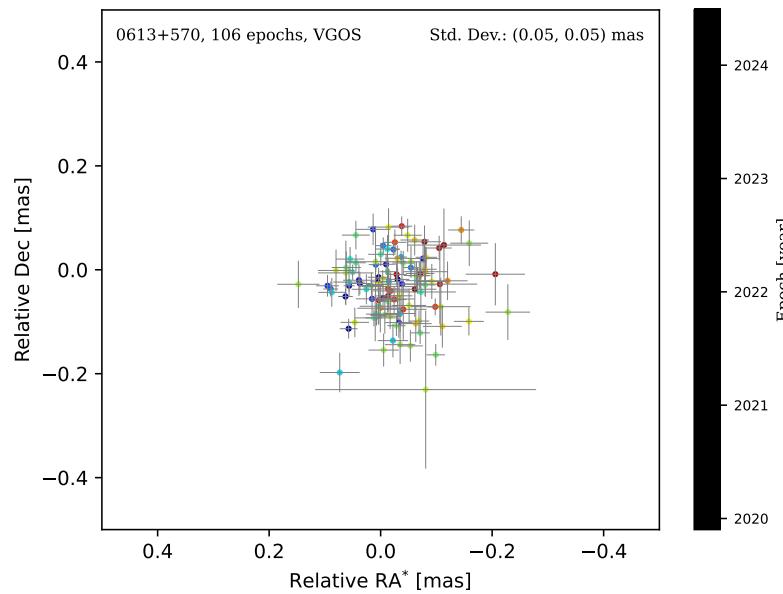

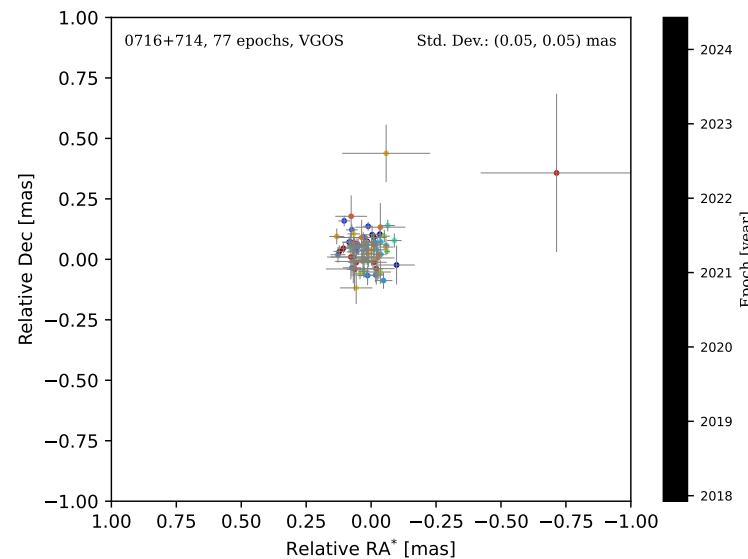

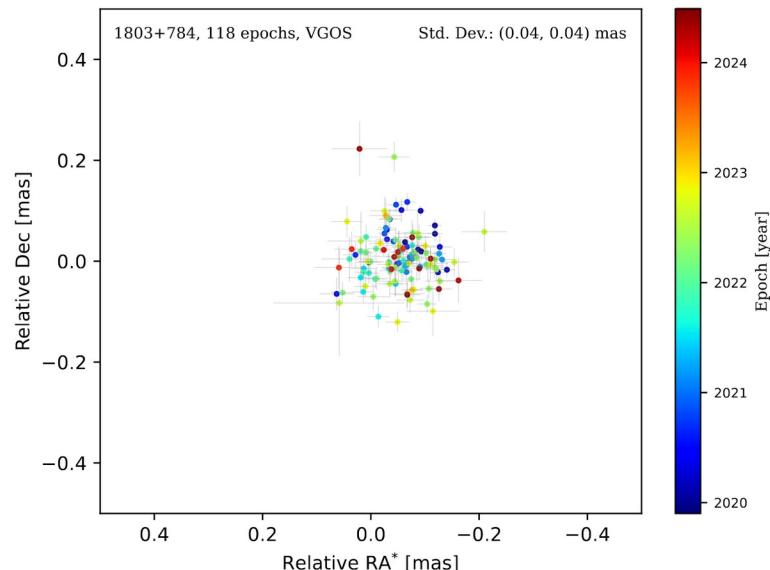

# Data and data analysis

- **Data**
  - 177 VGOS sessions
  - 377 AGNs
- **Imaging**
  - Closure phases
  - Closure amplitudes
- **Geodetic analysis**
  - Independent solutions
  - Global solutions

# One direction moving: 2229+695

2022 JAN 27

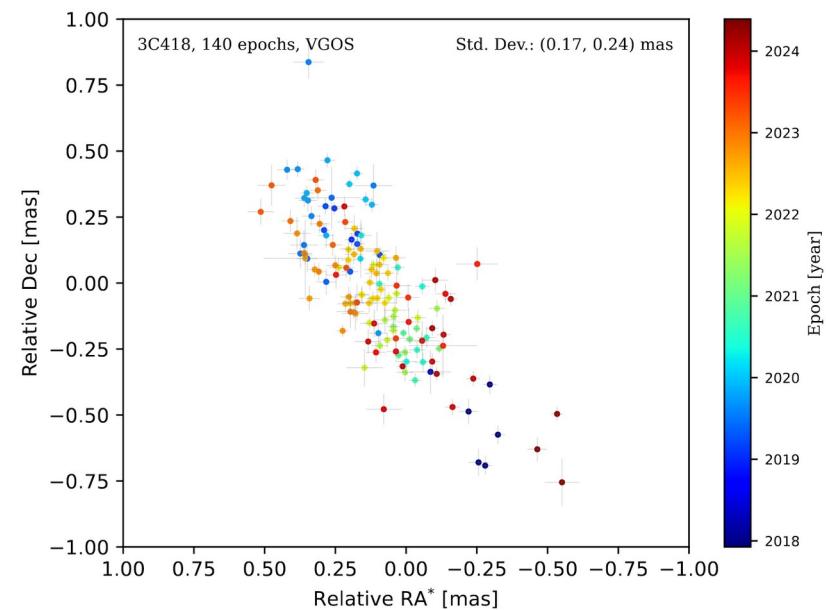

# One direction moving: 2229+695

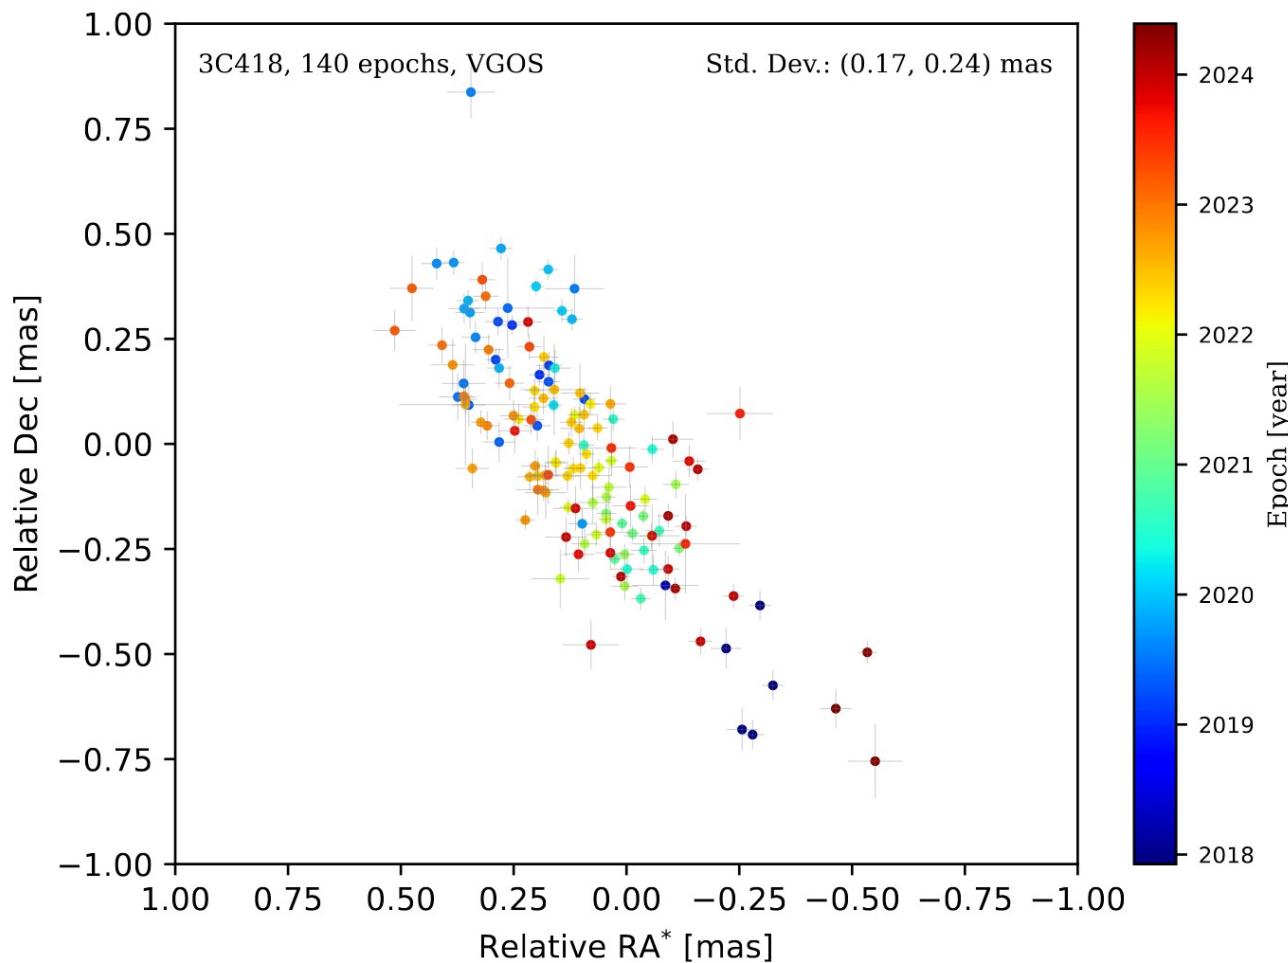

2022 JAN 27

# Two direction moving

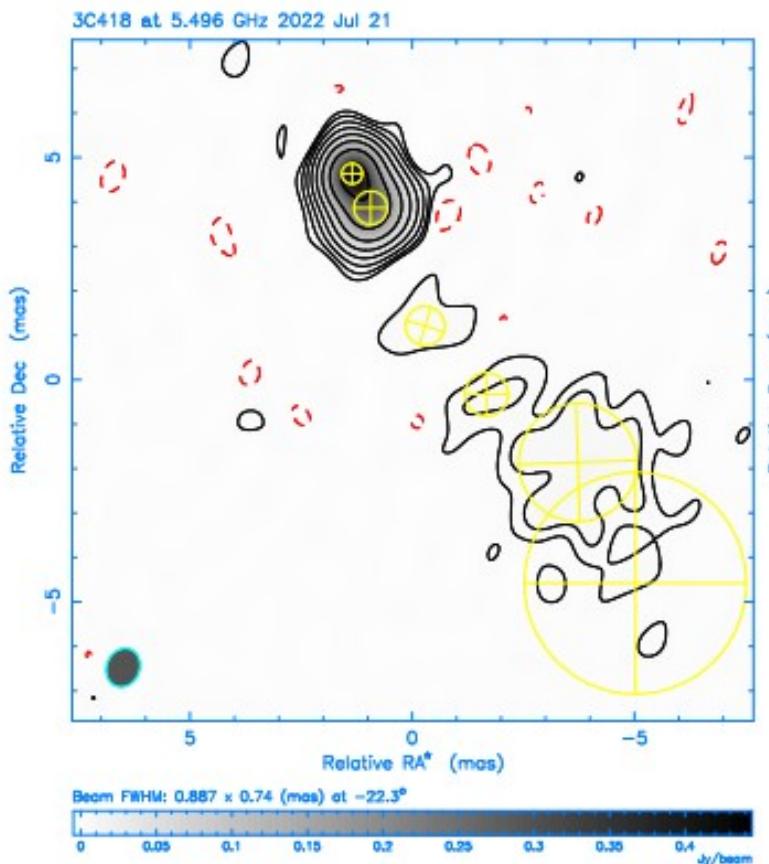

# Two direction moving: 3C418

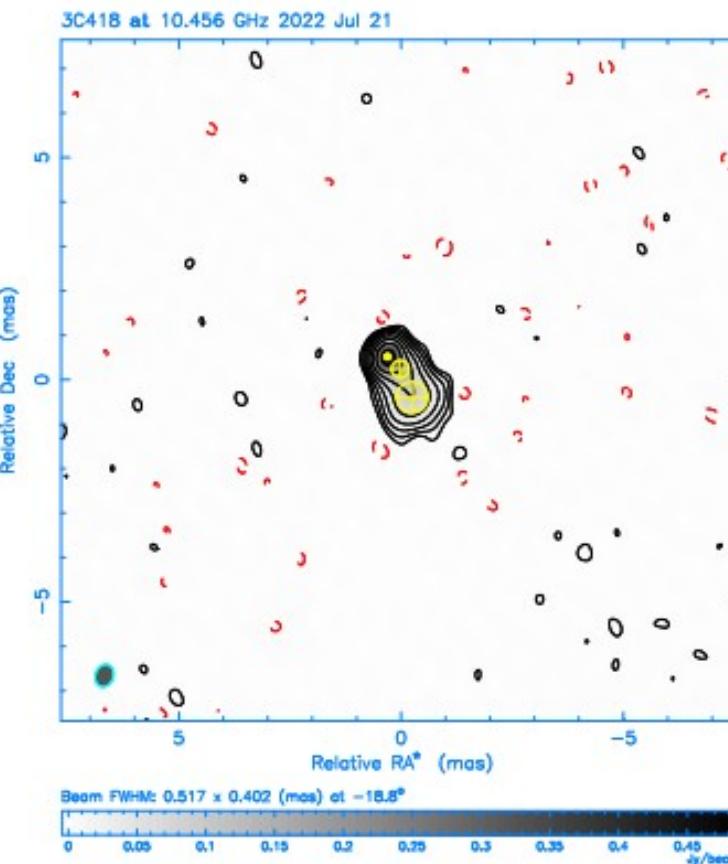

- Source position changes in its jet direction
  - Move towards east-north and west-south back twice from 2018 to 2024
  - Angular difference 1.1 mas
  - Typical behavior due to within beamsize structure

# 3C418: images

5.5 GHz

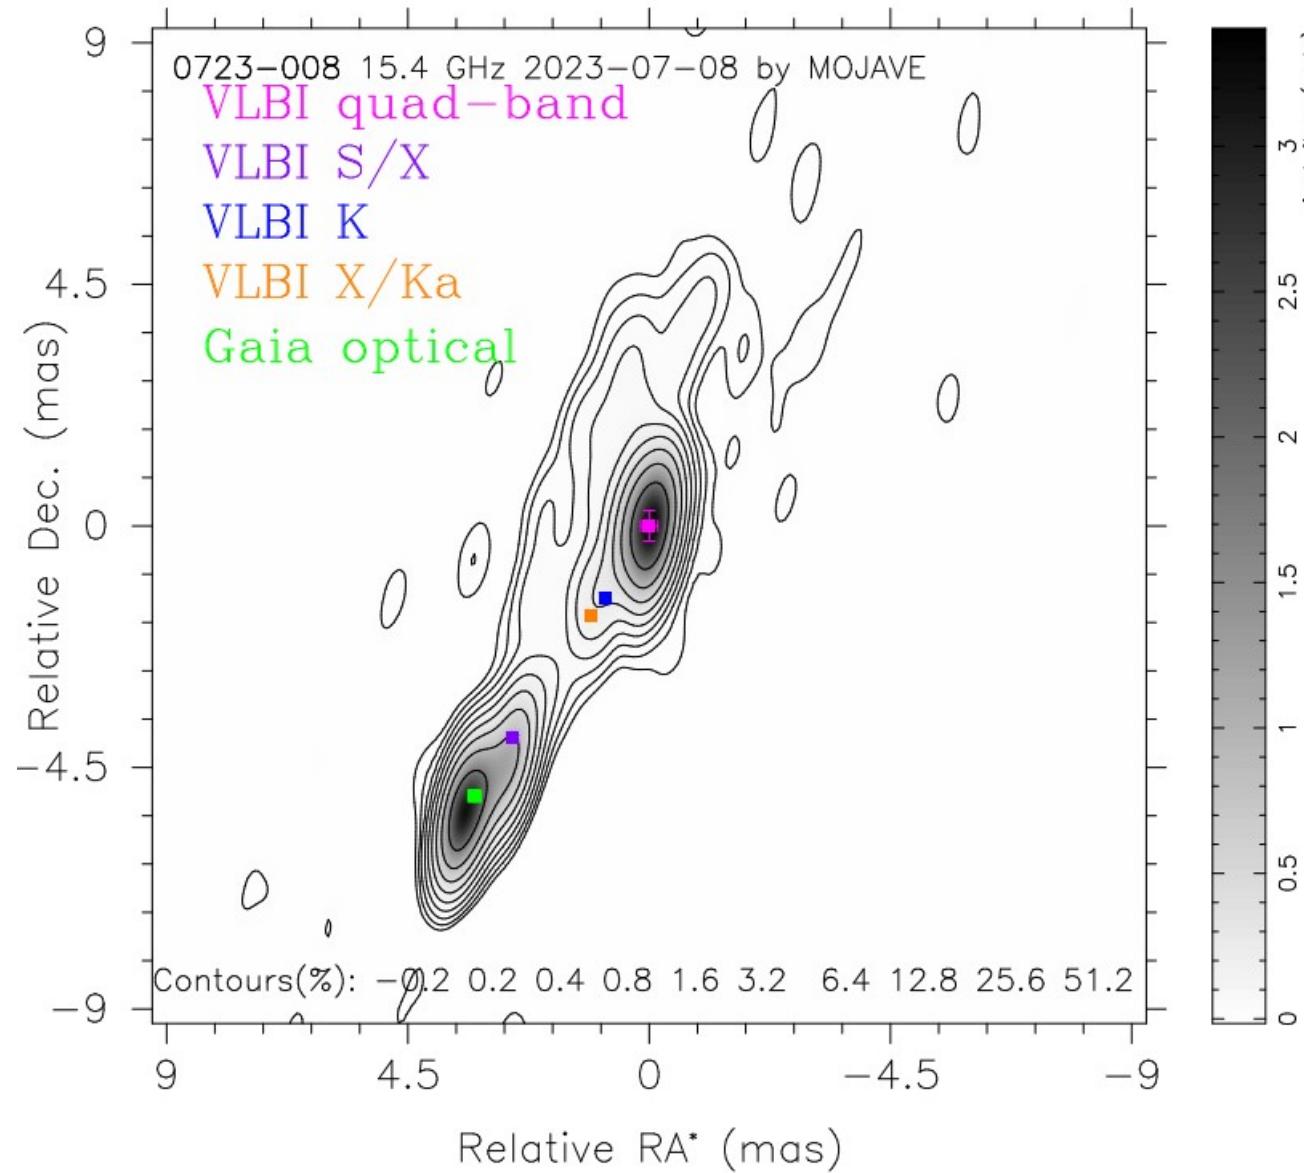

10.2 GHz

- VGOS beam size
  - 1.8 mas @ 3 GHz
  - 1.0 mas @ 5 GHz
  - 0.9 mas @ 6 GHz
  - 0.5 mas @ 10.5 GHz

- Extended structure at higher frequencies is un-resolved shifting the astrometric positions
- Image alignment over frequency

# Source position variations across frequency

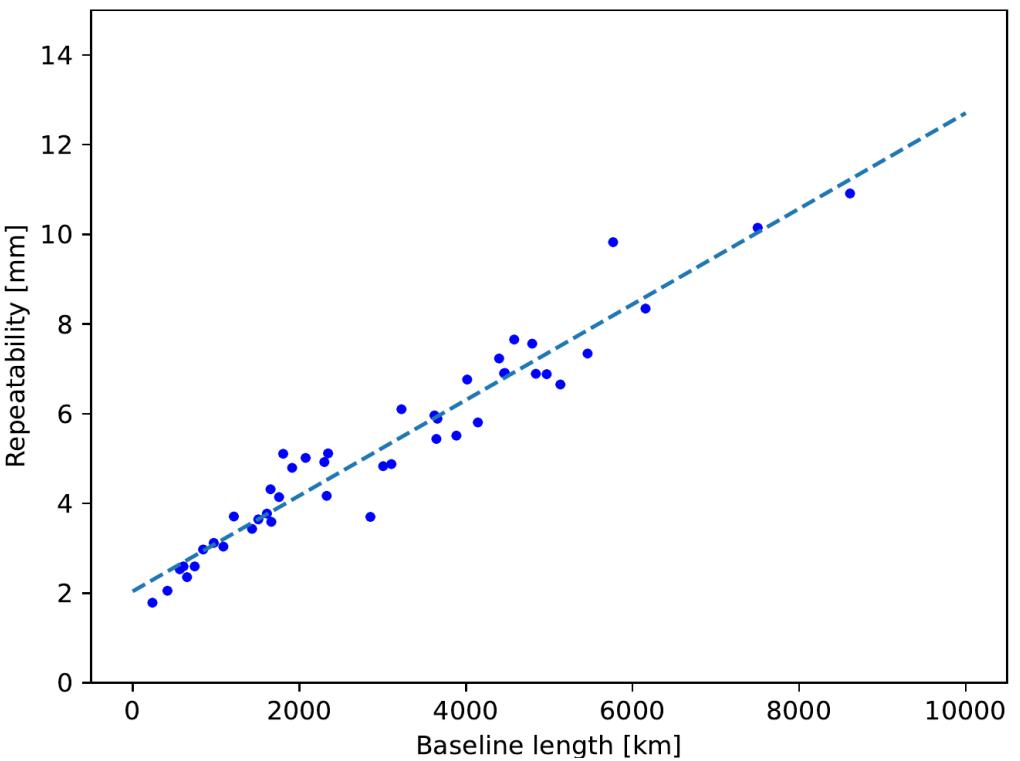

How to build a consistent CRF across frequency in the future?

# MOJAVE as testbed

---

- Processing MOJAVE observations in geodetic mode
- Collaboration with MOJAVE team
  - models of source structure
  - Images aligned over time

Results from 147 MOJAVE sessions since 2012

Baseline length repeatability degrades significantly with the length

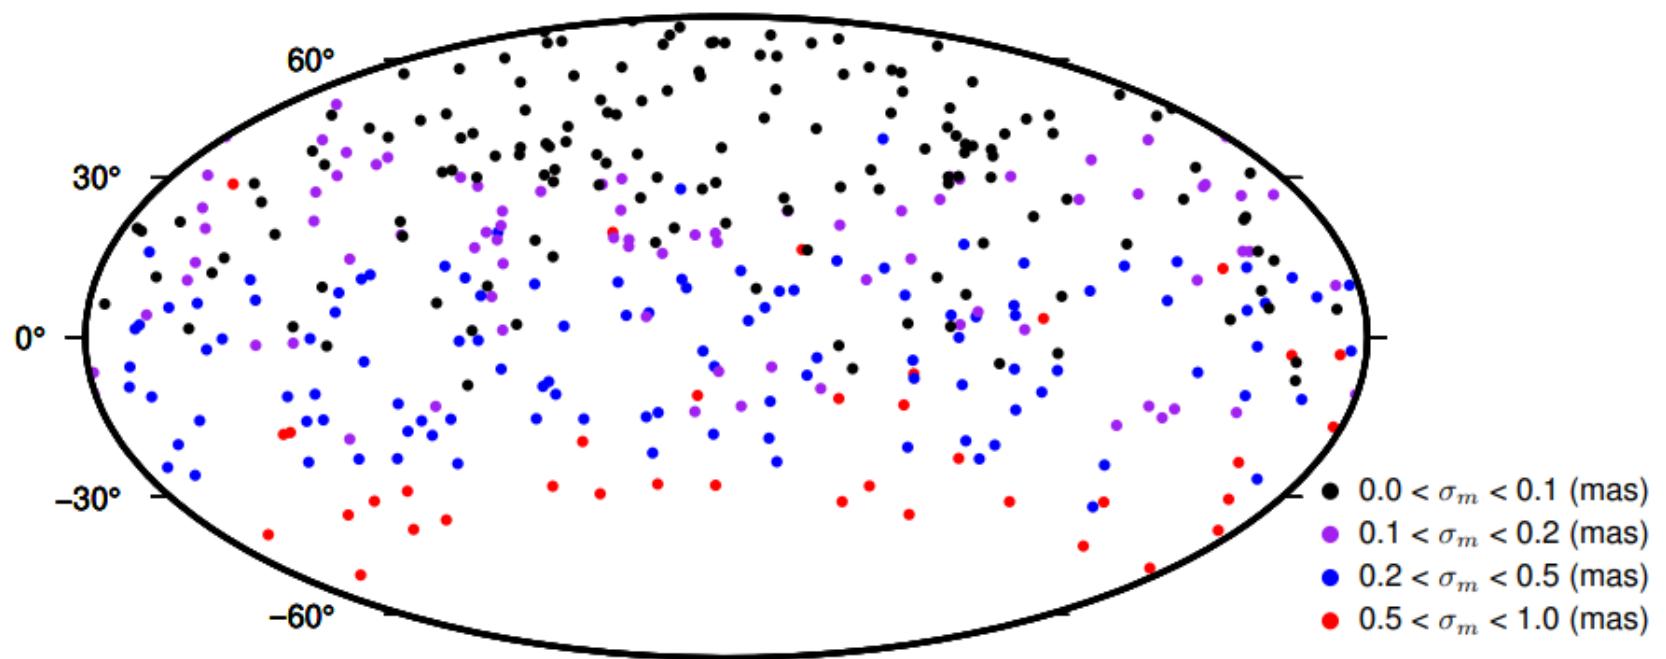

(Lister et al., 2018)

# Conclusion

---

- 1) Precision/white noise in VGOS source position  $< 40 \text{ } \mu\text{as}$
- 2) Contribution of source structure @  $0.1 - 0.2 \text{ mas}$
- 3) Astrogeodesy project aims to resolve this challenge for improving the accuracy of geodesy and astrometry
- 4) It is relevant for astrometry in the future radio facilities, like ngVLA

NOTE—Column (1) is the ICRF name with replacement of the first four characters to VGOS. In column (3), character “D” stands for the datum sources and “S” for the sources with positions as local parameters. The positions of the sources with character “S” are the mean estimates of these local positions. Columns (12) and (13) are the number of sessions and used observations, respectively. Column (14) is the number of delay rate observations and is kept only for consistency

# Effects of source structure

Source image of 1803+784 at 6.6 GHz from session VO0051  
(Xu et al., 2021)

Structure causes two major effects:

## 1) Phase center shift

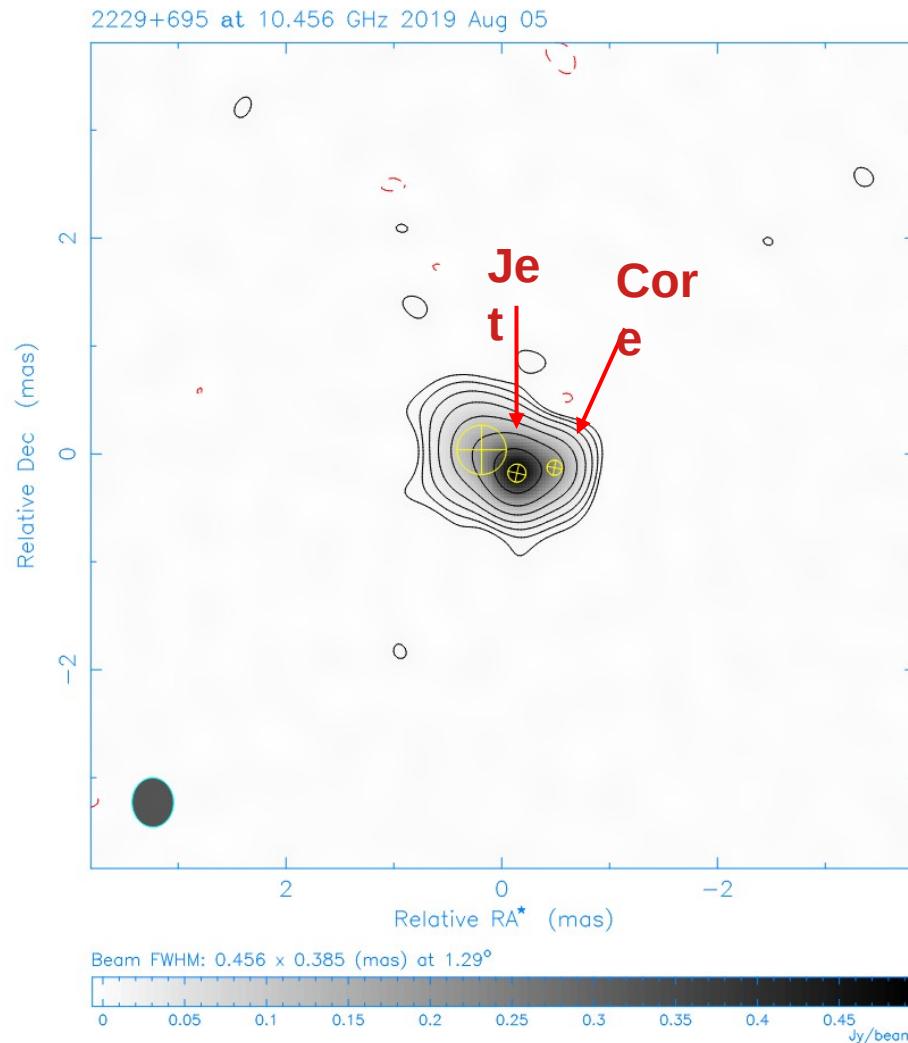

- Structure within the beam – “invisible” (Porcas 2010)

## 2) Systematic delay errors

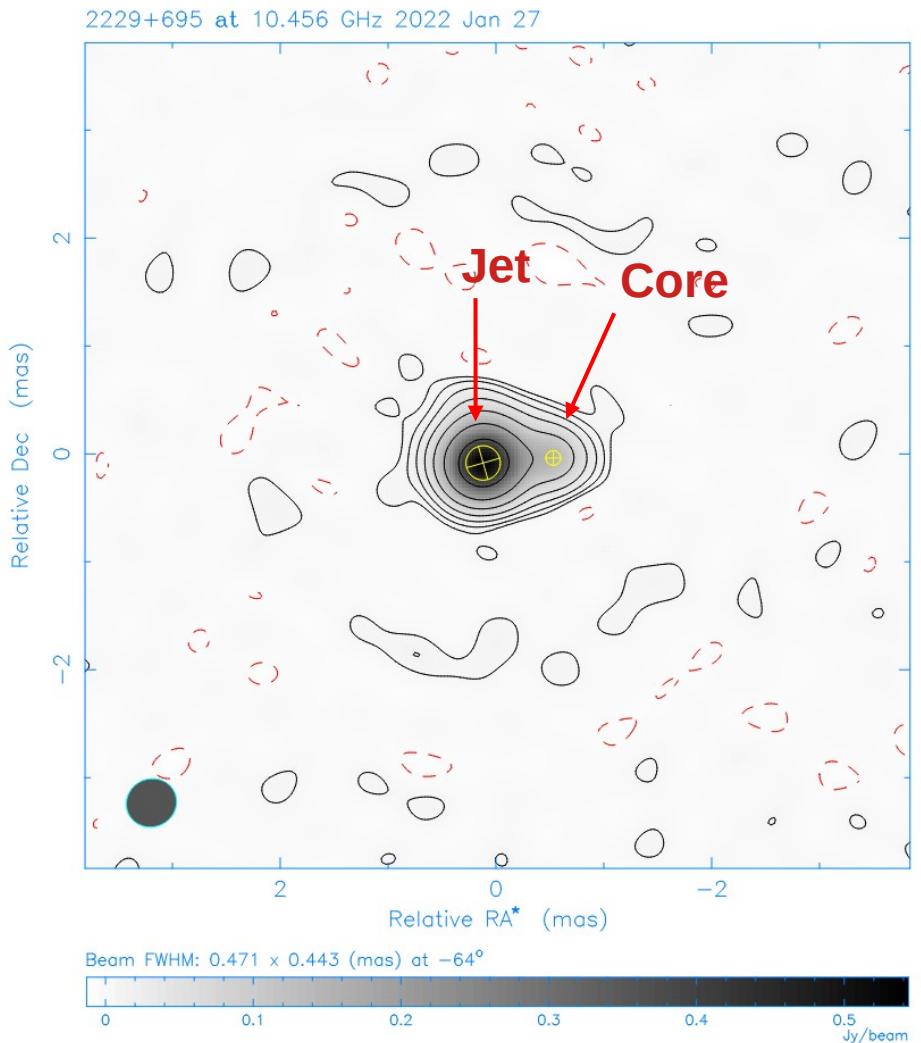

- Extended jet -- “visible”
- Closure delays
- Other geodetic parameters

# VGOS observations

## Data

- 177 24-hour experiments
- Simultaneously observing at four bands
- 13 VGOS antennas/fast slewing
- Short scan lengths
  - 7 – 30 seconds
- 370 radio sources

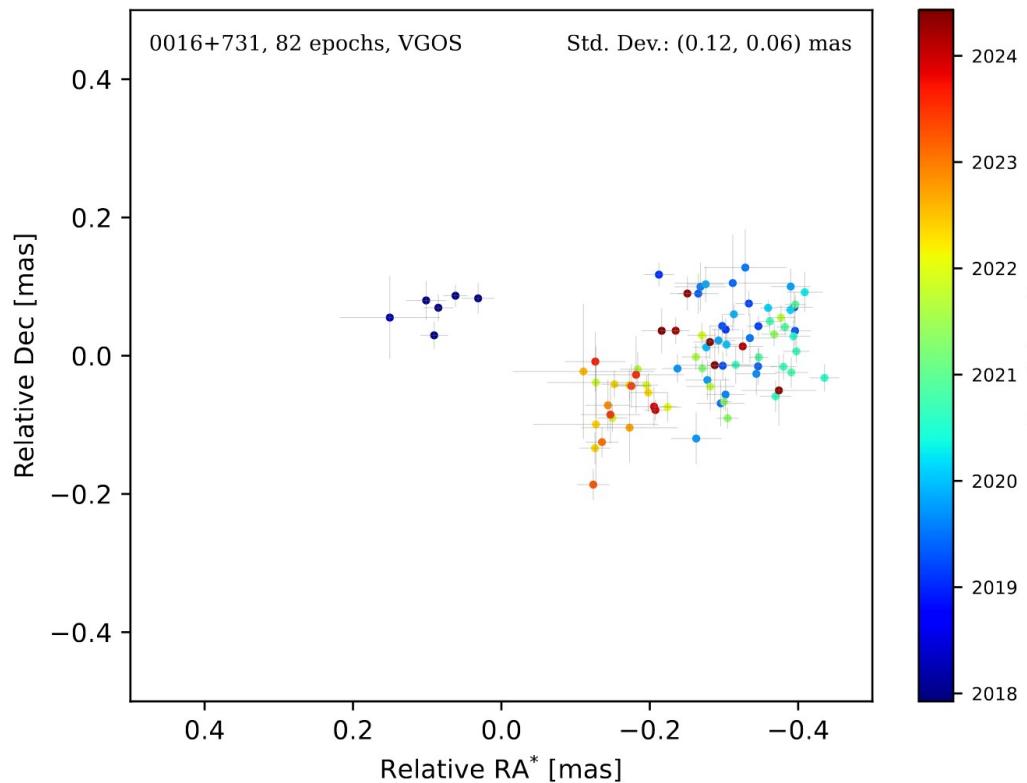

All of the closure delays of source 0529+483  
in 21 VGOS sessions. WRMS = 3.0 ps

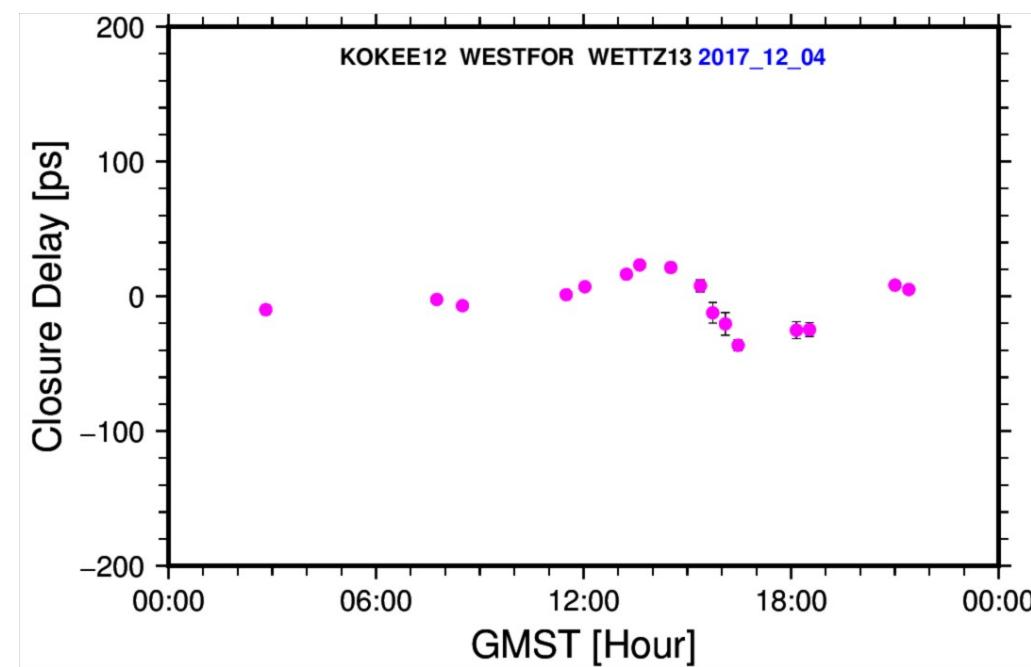

(Niell et al, 2018; Xu et al., 2021)

# Stability of VGOS source positions

## Impact of “invisible” structure

## Impact of “visible” structure

Source position variation @ 0.6 mas

Closure delays @ 100 ps

# Stability of VGOS source positions

- Error floor of VGOS source positions
- Uncertainty inflation

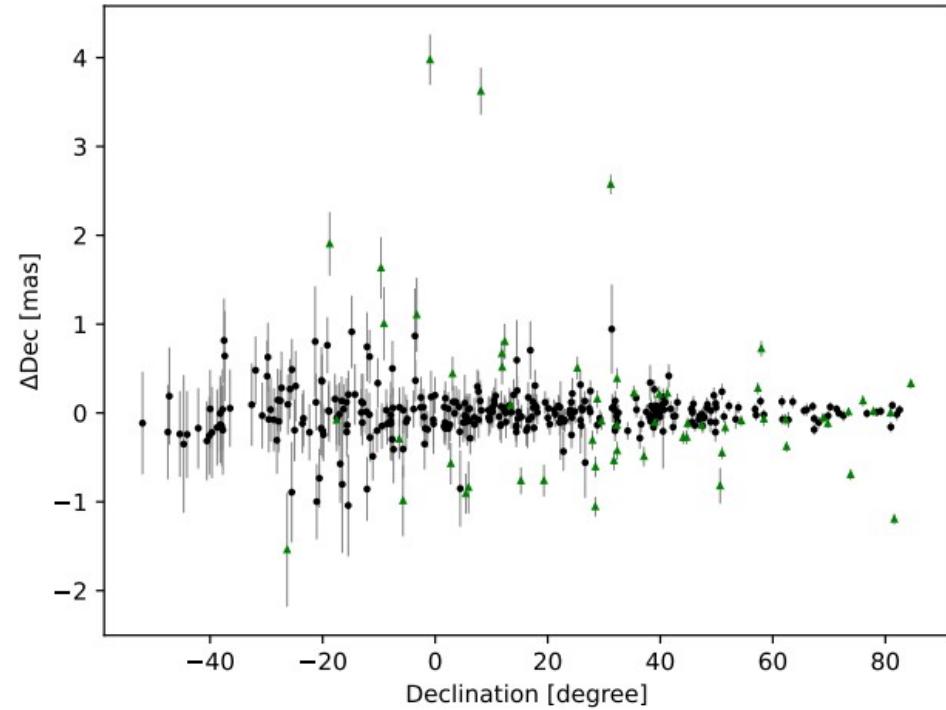

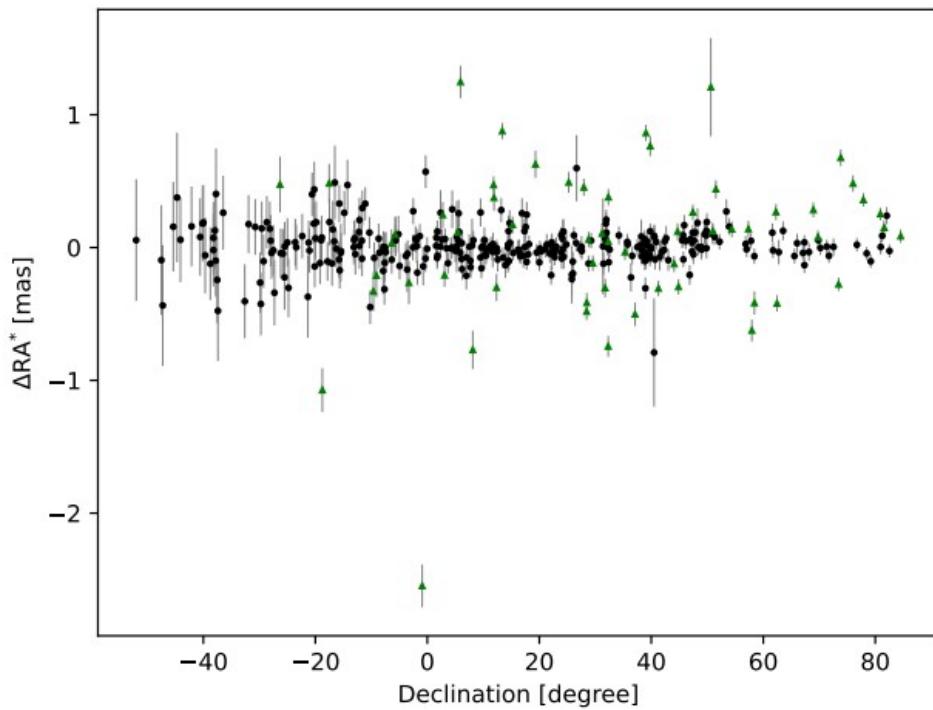

# Sensitivity of VGOS observations to source positions

---

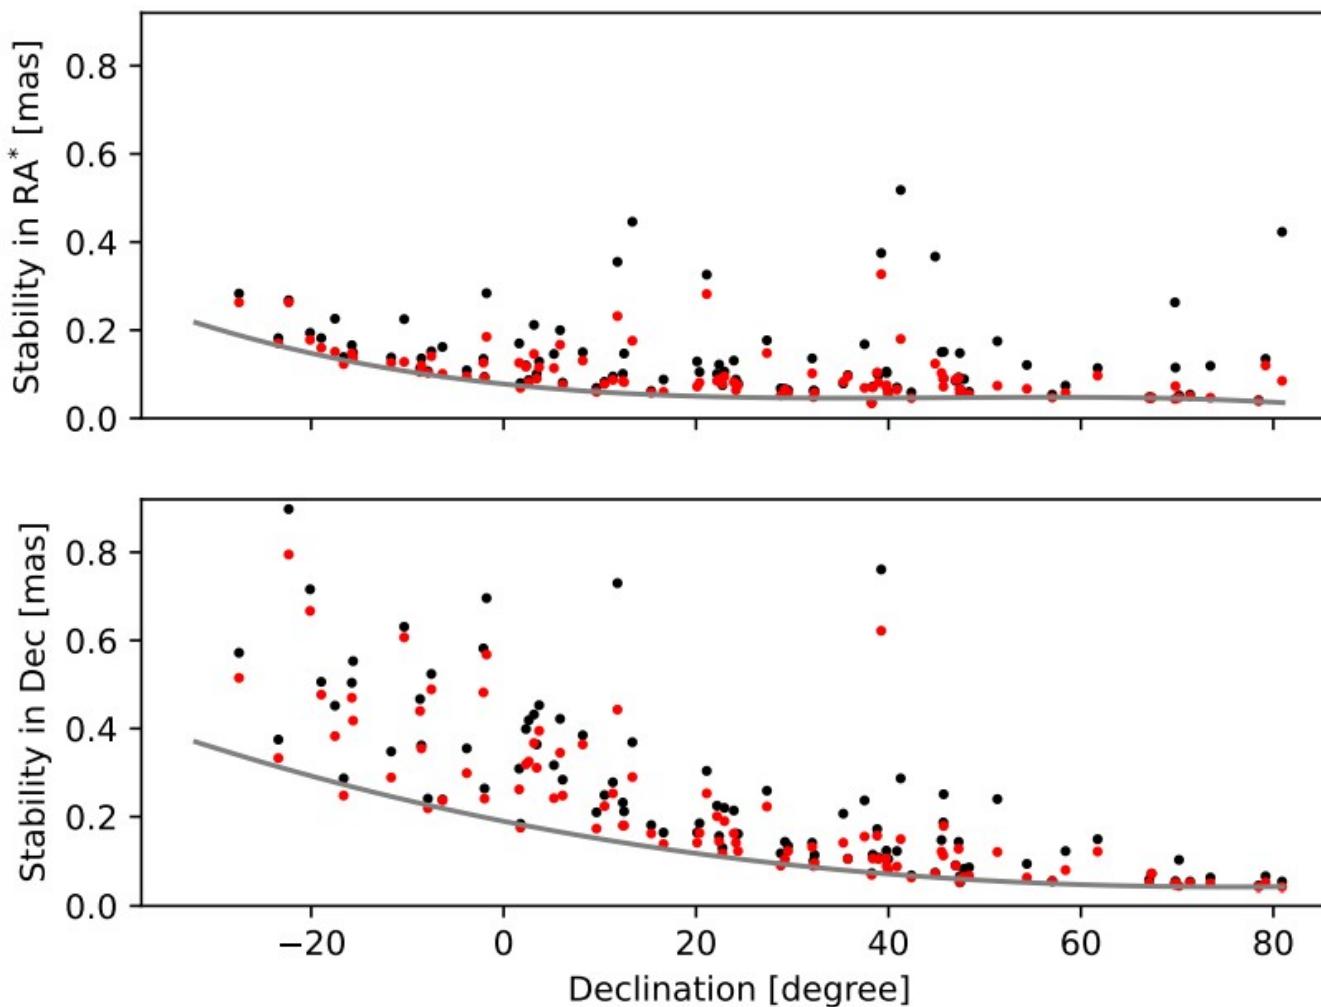

# Differences between VGOS and S/X

---

- The median and mean arc lengths over the 377 sources are 0.175 mas and 0.310 mas, respectively.

# Stability of VGOS source positions

- Time variations of VGOS source position on average is:
  - 0.1 mas for sources with declination > 20 degrees
  - 0.2 mas in RA and 0.5 mas in Dec for source with declination < 20 degrees

# Differences between VGOS and S/X
